DETAILED ACTION

Claim Objections

- 1. Claims 6 and 13 are objected to because of the following informalities:
- Claim 6: "the reference value" in line 3 lacks antecedent basis.
- Claim 13: "the reference value" in line 3 lacks antecedent basis.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless --

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 3. Claims 1-9 and 11-20 are rejected under 35 U.S.C. 102(b) as being anticipated by 20020025173 to Isobe et al.

Isobe et al. discloses an image forming apparatus comprising:

Art Unit: 2859

- a developing device (90) comprising a developing receptacle configured to accommodate
 a developer including a toner and a carrier, and a detector [0164] configured to output a
 signal corresponding to a toner density of the developer within said developing
 receptacle;
- a replenishing member (120) configured to perform replenishing operation that
 replenishes the toner to the developing receptacle in accordance with an output value
 from the detector;
- a first storage unit having a storage region configured to store information relating to characteristics of the developer (abstract); and
- a controller (430) configured to control the replenishing operation by said replenishing member based on the output value from the detector and the information relating to characteristics of the developer;
- said controller controls the replenishing operation based on the output value from the
 detector and a predetermined reference value and corrects the reference value using
 correction information based on the information relating to characteristics of the
 developer;
- the correction information is a correction table for correlating an environment or an amount of use of said developing device with an amount of correction for the reference value [0367-0368];
- an environment detection sensor [0363-0370] for detecting an environment within said image forming apparatus, wherein said controller corrects the reference value using information relating to the environment from said environment detection sensor,

'Application/Control Number: 10/808,782

Art Unit: 2859

information relating to an amount of use of said developing device, and the information relating to characteristics of the developer;

- said first storage unit further includes a storage region configured to store the information relating to the amount of use of said developing device [0082-0085];
- a second storage unit [0068-0085] having a storage region storing correction information
 for correcting the reference value, wherein said controller selects the correction
 information stored in said second storage unit based on the information relating to
 characteristics of the developer stored in said first storage unit, and corrects the reference
 value based on the selected correction information;
- said developing device is detachably mountable in a main body of said image forming apparatus [0089], and wherein said first storage unit is provided in said developing device;
- a cartridge [0089] comprising at least said developing device and an image bearing member is detachably mountable in said image forming apparatus, and wherein said first storage unit is provided in said cartridge;
- said first storage unit further includes a storage region storing an offset value for the reference value (via the deltaX and/or the correction constant in 0085), and wherein said controller controls the replenishing operation based on the offset value and the information relating to characteristics of the developer;
- said detector being an inductive sensor configured to output a signal;

Art Unit: 2859

- a developing receptacle configured to accommodate a developer including a toner and a carrier; a detector configured to output a signal corresponding to a toner density of the developer within said developing receptacle; and a storage medium configured to store information relating to said developing device, wherein said storage medium includes a first storage region configured to store information relating to characteristics of the developer used for supplying the developing receptacle with the toner;
- said storage medium further includes a second storage region configured to store
 information relating to an amount of use of said developing device, and a second storage
 region for storing information relating to an amount of use of the developing device
 [0082-0085];
- wherein the information relating to the characteristics of the developer is information for selecting correction information for correcting the reference value of said detector stored in storage means provided in said image forming apparatus, and wherein the information relating to the characteristics of the developer is information for selecting correction information for correcting a reference value of the detector stored in storage means provided in the image forming apparatus [0068-0085];
- wherein said storage medium further includes a third storage region for storing an offset value for a reference value of said detector (via the deltaX and/or the correction constant in 0085 and the third region being the portion of the first and/or second where the values are stored); and
- wherein said storage medium further includes a communication portion for communicating with said image forming apparatus (figure 1).

Art Unit: 2859

Claim Rejections - 35 USC § 103

- 4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 5. Claim 10 is rejected under 35 U.S.C. 103(a) as being unpatentable over Isobe et al. in view of U.S. 6,839,245 to Shida et al.

Isobe et al. teaches all that is claimed as discussed in the above rejections of claims 1-9 and 11-20 including that the detector is an inductive sensor.

Isobe et al. does not teach that the detector is a permeability sensor.

Shida et al. discloses that toner concentration detector is inductive and also a permeability sensor (column 2, lines 25-40). Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to make the inductive sensor, taught by Isobe et al., to be an inductive permeability sensor, as taught by Shida et al., in order to measure the toner concentration using a commonly available sensor for determining concentration.

Art Unit: 2859

Conclusion

6. The prior art made of record and not relied upon is considered pertinent to Applicant's disclosure. The prior art cited in PTO-892 and not mentioned above disclose related apparatuses, developing devices and storage mediums.

7. Any inquiry concerning this communication or earlier communications from the examiner should be directed to R. Alexander Smith whose telephone number is 571-272-2251. The examiner can normally be reached on Monday through Friday from 9:30-6:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Diego F. Gutierrez can be reached on 571-272-2245. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
